

Helping you reduce your environmental impact.

With a strong focus on sustainability, our goal is to help you reduce the overall environmental impact of every project. From products that are designed for efficient installation, through to reduced transport emissions via our 'factory-to-site' delivery model, Focus Glass Doors takes a holistic approach to sustainable business practices.

Sustainable Manufacturing

By reducing unnecessary emissions and waste at every step of the manufacturing process, we can deliver best-in-class glass doors with a low environmental impact.

We've heavily reduced the overall environmental impact of our business, with less transportation and a reduction in wasted time and energy associated with offshore manufacture and warehousing.

Plus, manufacturing locally and using Australian-made components where possible means we're doing our part to keep Australians in jobs.

Our knowledgeable team help you select the right doors to retrofit to cabinets and displays, substantially reducing energy usage for the end user

Designed for fast installation: reduced labour and less in-store disruption for a better customer experience

We use minimal packaging and a sophisticated trolley system to safely deliver our products

Our delivery trucks have an emissions rating equivalent to Euro 6 and are designed to take a full store load in one trip

High percentage of Australian made components, meaning less international transport emissions

Made from infinitely recyclable components including glass and aluminium

Greener Transport

Our sophisticated trolley system reduces the need for plastic wrapping and crating of frames to protect glass in transit. And, by using our own fleet of vehicles for transport we can control and reduce emissions.

Our trucks have an emissions rating of Euro 6 equivalent, meaning their average CO2 emissions are below 130 grams CO2e/km.

Designed to take a full store load in one trip, the truck remains at the project until completion which further reduces unnecessary kilometres and emissions.

Designed for Efficient Installation

Smart design is at the heart of our products, and by designing an easy-to-install system, we have reduced the number of nights required for installation.

This not only reduces interruption to the store's operations and the need for night supervision, but also reduces the amount of travelling required to and from the site.

Impact on the store's customers is kept to a minimum with no components or large deliveries made to the store prior to installation.

Our just-in-time delivery helps your project run smoothly, and the installation process is hassle-free: shelves don't need to be cleared and stock is protected with our tarping system.
